## Apple server admin tools

This disk contains remote administration tools, documentation, and utilities that you cannot install on the server. For detailed information about this update, visit this website. Installers The Server Administration Software installation package contains the tools needed for remote server administration. These apps require Mac OS X 10.5 or later. If you received this management device disk with Xserve, Apple Xserve Diagnostics software is also available to diagnose certain Xserve hardware problems. Server Assistant: You can use Server Assistant to install or configure Mac OS X Server on a remote computer. Server Sense is primarily used to configure Xserve systems without a connected display. Server Settings and Server Health Monitor The Server Settings and Server State widgets are used to remotely monitor and monitor the server when configured in the configuration of the standard or workgroup server. Server Administration The Server Administration application is used for remote administration of one or more servers. You can use it to manage file sharing points, configure service settings, monitor server activity, and provide detailed logging information for each service that is running. Server Monitor is used for remote administration and administration of one or more Xserve systems. Workgroup Manager You can use Workgroup Manager to remotely manage users, groups, and computer accounts in advanced server installations. Workgroup Manager can also be used to set up and manage settings for Mac OS X users. System Image Utility A System Image Utility application for creating and customizing NetBoot and NetInstall images. Xgrid Admin The Xgrid Admin app allows administrators to remotely manage clusters and monitor the activities of controls, agents, and the status of on-screen tasks. QuickTime Broadcaster With QuickTime Broadcaster and QuickTime Streaming Server, you can create professional-quality live events. QuickTime Broadcaster can be used to record live audio and video streams and forward them to QuickTime Streaming Server for redistribution. Documentation for Mac OS X Server includes on-screen assistance, as well as a package of guidance and management guides. The Documentation folder contains the Getting Started guide in PDF format. Français,Deutsch,English, Nederlands,Italiano,Español, Português,Polski,Suomi,Dansk,日本語,Norsk Bokmål,Русский,Português (Brasil), Svenska,Português, Suomi,日本語, Français,Deutsch,English, Nederlands,Italiano,Español, Dansk, Orsk Bokmål,Gb日本語,日本語, Svensk By John Rizzo Server Admin in OS X Lion Server) perform more complex tasks than the Server app. Server provides more opportunities and much more subtle control over the services it provides. Gives Server Administrators access to services that are not available in Server, such as DNS and push notification servers, firewalls, and software update servers. Server Server you can also track the number of servers and services that are running. Configure services using lion server admin You can use the Server administrator to configure and manage many features of Lion Server, including the Open Directory. To run the server administrator for the first time, follow these steps: If you are not already logged on to your Mac, log on as a local administrator. Open the Server administrator from the /Applications/Server folder. Double-click the name of a server in the left column to write down the logon screen. If you don't see the server, click Add (+) in the lower-left corner, and then click Add Server from the drop-down menu. In the Address box, type the host name of the server (if it is not yet displayed), and then type the administrator's user name and password. For best results, always specify a fully qualified host name for the server. You can also specify the server name with a .local ending if you created it when you installed Lion Server because DNS was not running on the network. Click Connect. You are now connected to the server and ready to manage your services. Click the triangle next to the server name to see an expanded list of enabled features. If the service you want to configure does not appear in the list, it is not turned on. In Server Administration, you must first turn on a service and then start it. To turn this feature on: On Server Admin, click the server in the sidebar to select it. Click the Options icon on the toolbar, and then click the Options tab. Select the check box next to the service, and then click Save in the lower-right corner. The service should now appear in the left column under Services. The line next to each feature in the list may have a few possible colors: Delete: The service is enabled but not running. Red: The service is indicating an error. Light green: Rarely, sometimes restart the service. Dark Green: The service works normally. Typically, you want to configure settings for a service when it is not running (with clean points). After you finish the settings, you can start running the service by clicking the triangle to the left of the

server to expand the list of features, and then clicking the service name. Click the Start button at the bottom left of the screen. Monitoring the server with the Server Administration Server administrator provides more monitoring services than the Server application. You can access them by clicking on the server in the left column. The General pane appears to provide information about the hardware and software configuration and status of the host Mac. The Logs icon gives you access to a variety of log files in the The Graphs icon provides live graphs of CPU usage and network traffic. The Server Update icon lists previous updates to Mac OS X Server and allows the update from this window. Support For Communities/Desktops/iMac Looks Like No One Has Responded In A While. Simply ask a new question to start the conversation again. Q: Where are the osx yosemitev10.2 iMac (27-inch, Late 2012), OS X Mountain Lion (10.8.5) Posted on Feb 12, 2015 8:58 PM Answer I have this question too (39) I have this question too Me too (39) Me too Page content loaded February 14, 2015 2:20 in response to adheroma Reply ultapadoma Hi tapa, I see that you are looking for some server administration tools OS I think that the necessary tools can be found on OS X Server in the App Store: to a part of Apple Support Communities!
